

## Chapter 3

### Sampling and Analysis Plan - Format and Contents

#### 3.1 General

This chapter contains general guidance for the format and contents of an SAP, including a brief discussion of each of the major elements. Several additions have been incorporated in order to accommodate the technical requirements identified within the USEPA guidance EPA QA/R-5 and EPA QA/G-5. However, due to the disparity in the adoption or enforcement of this guidance among the various USEPA regions and State regulating agencies, the existing two-component format has been retained. The use and application of this or other project plan formats are at the discretion of the USACE technical team members. However, the technical contents of the plans should be equivalent.

#### 3.2 Format Requirements

3.2.1 The SAP consists of two parts: an FSP and a QAPP. The FSP provides guidance for all fieldwork by defining in detail the sampling and field data-gathering methods to be used on the project. The QAPP describes the chemical data quality objectives, analytical methods and measurements, QA/QC protocols necessary to achieve the DQOs, and data assessment procedures for the evaluation and the identification of any data limitations. The FSP and QAPP should be submitted as a single document (although they may be bound separately to facilitate the use of the FSP in the field).

3.2.2 The FSP and QAPP are prepared prior to any field activities, but the FSP and QAPP may be amended or revised several times during the investigation activities using the protocol outlined in section 2.4 of this manual. Alternatively, the WP and associated SAP may develop a contingency-based, more flexible strategy to data gathering activities. This dynamic approach must outline a decision logic, which when supported by field analysis results promote decisions being made in the field about the subsequent site activities and/or refinement of the conceptual site model (CSM). Issues to be addressed within the SAP include establishing key field personnel experience requirements, the level of decision-making empowered to key field personnel, and communication protocols between the field and project stakeholders. For projects that encompass several subsites or involve a long-term contract (i.e., Total Environmental Restoration Contract), it may be beneficial to generate a comprehensive SAP that covers all aspects of sampling and analytical requirements conducted at a project and/or site. Then this document can be amended for individual delivery orders by generating an abbreviated, project-specific SAP. This addendum to the SAP must clearly identify the current effort's DQO, applicable matrices, site-specific sampling and analysis requirements, and any deviations from the comprehensive SAP. Information previously addressed within the comprehensive SAP may be referenced in the project-specific SAP addendums. When this approach is utilized, all SAP addendum topics referencing the comprehensive SAP must be verified by the USACE technical planning team during the document review process. Inadequate coverage of topics must be resolved prior to the SAP addendum execution. Preparatory phase inspections (field audits) must ensure that all appropriate plans (comprehensive and addendum SAPs) are available onsite and field personnel are familiar with procedures included within both.

3.2.3 Table 3-1 lists the typical elements that should appear in the FSP and QAPP. Depending upon the size and/or complexity of the project, all of the elements identified in Table 3-1 may not be appropriate for every project. In these instances, the format may be abbreviated or modified to accommodate the individual project activities.

Table of Contents

I. Field Sampling Plan (FSP)

Title Page  
Table of Contents

- 1.0 Project Background
  - 1.1 Site History and Contaminants
  - 1.2 Summary of Existing Site Data
  - 1.3 Site-Specific Definition of Problems
- 2.0 Project Organization and Responsibilities
- 3.0 Project Scope and Objectives
  - 3.1 Task Description
  - 3.2 Applicable Regulations/Standards
  - 3.3 Project Schedule
- 4.0 Nonmeasurement Data Acquisition
- 5.0 Field Activities by Area of Concern (AOC)
  - 5.1 Geophysics
    - 5.1.1 Rationale/Design
      - 5.1.1.1 Method
      - 5.1.1.2 Study Area Definition and Measurement Spacing
    - 5.1.2 Field Procedures
      - 5.1.2.1 Equipment
      - 5.1.2.2 Preliminary Method Testing and Early Termination Procedures
      - 5.1.2.3 Instrument Calibration and QC Procedures
      - 5.1.2.4 Field Progress/Interpretation Reporting
      - 5.1.2.5 Measurement Point/Grid Surveying
      - 5.1.2.6 Data Processing
      - 5.1.2.7 Potential Interpretation Techniques
  - 5.2 Soil Gas Survey
    - 5.2.1 Rationale/Design
      - 5.2.1.1 Soil Gas Sample Locations
      - 5.2.1.2 Sample Collection and Field and Laboratory Analysis
      - 5.2.1.3 Background, QA/QC, and Blank Samples and Frequency
    - 5.2.2 Field Procedures
      - 5.2.2.1 Drilling Methods and Equipment
      - 5.2.2.2 Materials (Casing, screen, etc.)
      - 5.2.2.3 Installation
      - 5.2.2.4 Sampling Methods
      - 5.2.2.5 Field Measurement Procedures and Criteria
      - 5.2.2.6 Documentation
  - 5.3 Ground Water
    - 5.3.1 Rationale/Design
      - 5.3.1.1 Monitoring Well Location and Installation
      - 5.3.1.2 Sample Collection and Field and Laboratory Analysis
      - 5.3.1.3 Upgradient, QA/QC, and Blank Samples and Frequency
    - 5.3.2 Monitoring Well Installation
      - 5.3.2.1 Drilling Methods and Equipment
      - 5.3.2.2 Materials
        - 5.3.2.2.1 Casing/Screen/Centralizers
        - 5.3.2.2.2 Filter Pack, Bentonite Seal, Cement/Bentonite Grout
        - 5.3.2.2.3 Surface Completion
        - 5.3.2.2.4 Water Source
        - 5.3.2.2.5 Delivery, Storage, and Handling of Materials
      - 5.3.2.3 Installation
        - 5.3.2.3.1 Test Holes
        - 5.3.2.3.2 Soil Sampling and Rock Coring During Drilling
        - 5.3.2.3.3 Geophysical Logging

(Sheet 4 of 4)

### 3.3 Content of Major Elements

The FSP describes the field activities to be performed and defines the procedures and methods that must be used to collect field measurements and samples. Issues include collection of geophysical data; drilling of soil borings; installation of ground water monitoring wells; and procedures for collection of multimedia samples, field control samples, and any field measurements. The FSP also addresses the sample packaging and shipping requirements, proper handling and disposal of investigation-derived wastes (IDWs), field documentation procedures, corrective action procedures, and the project schedule.

The QAPP focuses primarily on the analytical methods and QA/QC procedures that are used to analyze the samples and manage the data. The QAPP should include the organization and responsibilities of project laboratory and data assessment personnel; QA objectives; sample receipt, handling, custody, and holding time requirements; analytical procedures, equipment preventive maintenance, calibration, internal quality control procedures, and performance/system audits; data reduction, review, and reporting; and data assessment, data useability, and DQO reconciliation. The recommended requirements for the contents of FSPs and QAPPs are discussed in the following subsections. Additional information may be obtained from EPA QA/R-5, EPA QA/G-5, and other references provided in Appendix A.

3.3.1 Title page. The title page should be the first page of the SAP. The following items should appear on the title page: the name of the document, site name and location, USACE contract number (if applicable), regulatory authority under which the activities are being performed (CERCLA, RCRA, etc.), and date of preparation. If necessary, due to project modifications, the SAP may be assigned a document and/or revision number. If tasks performed under the SAP are executed by a contractor, Figure 3-1 is an example signature block that should appear at the bottom of the title page. If the recommended signatures are difficult to acquire, it is suggested that a statement be added that the approved SAP was provided to the appropriate parties (i.e., laboratories, drillers, data assessment personnel, etc.), identifying names of recipients and the date.

COMMITMENT TO IMPLEMENT THE ABOVE SAMPLING AND ANALYSIS PLAN		
Contractor's Project/Task Manager (print)	Signature	Date
Contractor's QC Manager (print)	Signature	Date
Other as Appropriate/Affiliation* (print)	Signature	Date
Other as Appropriate/Affiliation* (print)	Signature	Date
Other as Appropriate/Affiliation* (print)	Signature	Date

\* Commitment signature is required for any ancillary sampling, analytical, or data assessment support provided by a contractor or subcontractor. For example, the Contractor's laboratory QC manager or director should sign the title page if analytical services are provided.

**Figure 3-1. Example signature block**

3.3.2 Distribution list. This list should include all recipients of the SAP, and any addendums or modifications thereto.

3.3.3 Table of contents. This should be a very general table of contents that outlines the layout of the SAP. Table 3-2 is an example.

3.3.4 Field sampling plan (FSP). An FSP should include the following:

---

**Table 3-2**  
**SAP Table of Contents Example**

---

Introduction

- I Field Sampling Plan
  - Title Page
  - Table of Contents
    - 1.0 Project Background
    - 2.0 Project Organization and Responsibilities
    - 3.0 Project Scope and Objectives
    - 4.0 Nonmeasurement Data Acquisition
    - 5.0 Field Activities by Area of Concern (AOC)
    - 6.0 Field Operations Documentation
    - 7.0 Sample Packaging and Shipping Requirements
    - 8.0 Investigation-Derived Wastes (IDW)
    - 9.0 Field Assessment/Three Phase Inspection Procedures
    - 10.0 Nonconformance/Corrective Actions

    - 7.0 Laboratory Operations Documentation
    - 8.0 Data Assessment Procedures

Appendices

- A References
  - B Standard Forms to be Used
  - C List of Abbreviations and Acronyms
- 

3.3.4.1 Title page. The FSP should have an abbreviated title page that includes the name of the document (e.g., Phase I Remedial Investigation Field Sampling Plan), document and/or revision number, and the date it was prepared.

3.3.4.2 Table of contents. The table of contents should list the FSP elements, any appendices that are required to augment the FSP, tables, and figures.

3.3.4.3 Project background. This section of the FSP should be as specific as possible. Sufficient information should be included to permit a technical person unfamiliar with the project to evaluate the sampling and analytical approach presented. If items discussed here are in the project work plan, they do not need to be repeated, but they should be incorporated by reference. For those projects that do not require a work plan, refer to paragraph 1.7.1 for additional topics included within this section. This section of the FSP should include a description of the location, size, and important physical features of the site, such as ponds, lagoons, streams, and roads (a map showing the site location and layout would be helpful). A chronological site history including descriptions of the use of the site, complaints by neighbors, permitting, and use of chemicals should be provided. The historical data from previous sampling efforts at the site should be identified and summarized. An assessment of the quality of the historical data should be included as well as a discussion of problems previously encountered. The

effects of this information on the current project should also be discussed. This section should also describe the site problem to be resolved and the project approaches planned to work toward this resolution.

3.3.4.4 Project organization and responsibilities. This element of the FSP identifies key field personnel or organizations that are necessary for each field activity during the project. For remedial action and/or construction projects, this element will be expanded to include key personnel for all activities including project planning, since no overall project work plan is required. A table or chart showing the organization and lines of authority should be included. When specific personnel cannot be identified, the organization with the responsibility should be listed. The organization chart should also include all subcontractors and their key points of contact (POC). Separate organization charts for subcontractors may be referenced as needed. The organization chart should identify QC managers, including POCs of subcontractors, and should illustrate their relationship to other project personnel. The QC managers should be organizationally independent of the project management so that the risk of conflict of interest is minimized. This section of the FSP should also describe the responsibilities of all project field personnel, including sampling personnel, liaison between field and laboratory, and QC managers. It should designate responsibility for planning, coordination, sample collection, disposal of investigation-derived waste, and sample custody. This section should also identify any special training requirements and/or personnel certifications necessary to perform the project work.

3.3.4.5 Project scope and objectives. This section should identify the project activities planned, incorporating QA elements to be implemented to support those activities, any relevant regulatory standards, and the project schedule. EM 200-1-6 provides information on the QA elements that may be used for project chemical data quality assessment. Project QA procedures include laboratory validation, field and laboratory audits, PE samples, data validation procedures, etc. The project assessment activities employed should be discussed as they pertain to the general QA objectives identified for the project. Specific objectives of a sampling effort that describe the intended use of data should be clearly and succinctly stated. These objectives should satisfy not only the intended uses of the data, but also applicable regulatory standards or client preferences. This section of the FSP should also discuss special situations where site access may need to be obtained from private property owners, if applicable. In addition, an outline should be included of the project schedule based on client and regulatory requirements. Items listed on the project schedule should include project plan review periods, easement/permit periods, fieldwork, sample analysis, data management and validation, and project report writing.

3.3.4.6 Nonmeasurement data acquisition. This section of the FSP should describe those data needed from nonmeasurement sources. This may include information obtained from databases, literature, handbooks, local planning authorities, and other specific organizations. Information of this type may be needed to support risk assessment (local relevant or significant habitats, endangered species, future land uses, and well surveys); geological data (site bedrock formations, soil series); hydrogeological data (local or regional aquifers); meteorological data; data supporting modeling activities, etc.

3.3.4.7 Field activities by area of concern (AOC). This section of the FSP discusses the field activities planned for the work effort. For ease of review and referencing, it is recommended recommend that the SAP field activities be organized by area of concern (AOC) initially, with applicable matrices for that area managed as subsections.

3.3.4.7.1 Rationale/design. This section of the FSP discusses the rationale for each of the field activities. Each subsection that describes the matrices to be sampled within the AOC should include the

rationale behind the required number of field samples; the strategy (statistical, judgmental, and/or random basis) for selecting the particular sampling location (as discussed in Instruction C-1, Appendix C); a summary of the estimated or required number of field, background/upgradient, and field control samples; whether temporal changes can affect the representativeness of the sample; and the type of samples (composite or discrete). If a grid pattern is to be used to locate sample points, a discussion of the grid dimensions and layout should be included. Procedures should be defined for how sample locations are to be marked for future reference. As an alternative to the prescriptive approach of defining sample numbers and locations, is developing a decision logic that is used in conjunction with field analytical results to support onsite decision-making on the progress and direction of subsequent site sampling activities. Maps should be included to present site/AOC boundaries, any significant features, onsite buildings, ground water flow, existing monitoring wells, proposed sampling points, and any known contamination or plumes.

3.3.4.7.2 This FSP section should also discuss the analytical protocol and the rationale on how that relates to the site history and objectives of the work effort. Note any relevant action or decision levels. Also note when analytical protocols will change or differ within the same matrix, and the rationale for this approach. For instance, when based upon preliminary results, subsequent sample analytical protocols are abbreviated, or target compound lists are short-listed. The use of tables is suggested to present the information on sample analytical protocols, including appropriate analytical method numbers. Reference the QAPP portion of the SAP for details on method target analyte lists, sensitivity requirements (detection and quantitation limits), holding times, etc. Refer to Appendix I for details on analytical chemistry requirements. This FSP section should also list all field measurements that will be made during the project, noting the field analytical technologies, the protocols used, and the onsite decisions that the field data will support. Attach all field analytical method SOPs to the SAP. Identify the site-specific indicator compounds to be monitored, which samples will undergo field analyses, and how the data will be used / applied to a decision logic, or the effect on the sampling scheme this data will have. For instance, field screening data may direct samples for offsite definitive analysis, may define an appropriate low-level or high-level analytical method, or may be used to supplement a larger data set from which to support project decisions. Depending on the intended use of the field data, comparability to a definitive analysis may be an important factor and should be discussed with data users. Recommend performing bench or pilot studies, field trials, or establishing interim milestones early in the work effort to compare the field analytical results to definitive results to assess the correlation between the techniques and the viability of the field analytical technique. Further recommend that a percentage of field analyzed samples undergo redundant definitive analysis throughout the project to update the correlation, accuracy, and precision goals of the field analytical technique based on data's use. Verification should encompass samples that cover the entire range of contamination found onsite. Refer to Appendix H for details on field analysis technologies implementation. The discussion of field control samples should include the objective and rationale for these samples (how the data will be used), as well as the location and frequency for collecting/submitting these samples. This may include QA and QC duplicates, matrix spike/matrix spike duplicates, double-blind PE samples, equipment blanks, and/or trip blanks. This frequency may be expressed as a definitive number or percentage of the total number of samples collected. The sample locations may be identified qualitatively (e.g., the samples anticipated or noted as most contaminated) or by a specific area or sample location. Refer to Instruction G-2, Appendix G, for information on field control samples that may be used to assess field activities. It is recommended that all field samples and field control samples planned be summarized in tabular form. This table should indicate by sample location or area of concern the total number of samples for each matrix and associated QA/QC samples. For projects involving a large number of samples or analyses, it may not be possible to include all matrices in a single table. For such cases, two or more tables may be necessary. Table 3-3 is an example of a subsurface soil sample summary table.

Table 3-3  
Sample Summary Table for Subsurface Soils

Sample Location	Sample Depth <sup>1</sup>	Sample Number (Primary Lab)	QC Sample Number (Primary Lab)	Associated Trip Blank Number (Primary Lab)	Associated Rinsate Blank (Primary Lab)	Sample Number (QA Lab)	Associated Trip Blank Number (QA Lab)	Associated Rinsate Blank (QA Lab)	EPA 8260 <sup>2</sup>	EPA 8270 <sup>2</sup>	EPA 6010 <sup>2</sup>	EPA 8081 <sup>2</sup>

	8-12 ft bgs	T-5/S-3	-	TB-2	-	-	-	-	X	-	-	-
T-11	6-8 ft bgs	T-11	-	TB-2	RB-1	-	-	-	X	X	X	X
T-14	6-8 ft bgs	T-14	-	TB-2	RB-2	-	-	-	X	X	X	X
T-23	2-4 ft bgs	T-23	-	TB-2	RB-2	-	-	-	X	X	X	X

Notes: 1. The spatial relationship of sample and blank numbers in the table is important. This design of the sample numbers themselves is not required. However, duplicate samples must be blind to the primary laboratory.

2. USACE policy does not require trip or rinsate blanks for soil sampling activities, but allows for them if project-specific considerations warrant.

3. This table should be prepared prior to field activities and included in the SAP. The table prepared after field activities would document any deviation from the plan.

<sup>1</sup> bgs = below ground surface.

<sup>2</sup> The most recently promulgated versions of these methods taken from EPA/SW-846 must be used.

**3.3.4.7.3 Field procedures.** This section of the FSP addresses the field procedures for sampling each matrix within an AOC and should include a description of the sampling equipment (including material it is constructed of), any special conditions that are required for the preparation or installation of that sampling equipment, field measurements, sample collection, sample handling, sample packaging (including sample containers and preservatives), and equipment decontamination. Sample handling procedures may encompass techniques for compositing subsamples (define number of subsamples, grid patterns, etc.), homogenizing solid matrices, splitting of replicate samples, filtering aqueous matrices, or the special handling of solid samples for volatile organic compounds (VOC) analysis. Any special care in sample handling to avoid cross-contamination or unnecessary loss or degradation of contaminants should be defined. The use of maps, figures, charts, flow diagrams, or tables is recommended to clearly delineate a sampling program. Provide tables for identification of appropriate sample container numbers, types, and sizes by matrix/chemical parameter; preservatives; and analytical holding times. Also note when two or more sample analyses may be combined into one sample container. Relevant SOPs should be included within the SAP to identify appropriate step-by-step procedures for sample acquisition, handling, and packaging. Refer to the tables and instructions/SOPs included within Appendices B and E for additional guidance on these subjects. This section of the FSP should also include field analysis procedures for calibration and analysis, the acceptance criteria, and the required actions based on the field results. The specifications and requirements for field instrumentation, including the initial and continuing calibration, calibration verification, maintenance and inspection schedules, any factors that limit use of the equipment, as well as the requirements for field data evaluation and reporting must be outlined in the FSP. Table 3-4 is an example of a field instrument calibration table that may be used on projects. Finally, each section should discuss any time constraints or other difficulties with sending samples to the laboratory. Specify contingencies in the event of delays and/or slippage in the schedule. Additional information on field activity procedures is presented in the following subsections and in Appendices C, D, and E by individual matrices or sample handling technique.

**Table 3-4**  
**Field Instrument Calibration Table**

<b>Instrument Manufacturer</b>	<b>Analyzer Name</b>	<b>Detector</b>	<b>Chemical Parameter<sup>1</sup></b>	<b>Calibration Requirement<sup>2</sup></b>	<b>Performance Checks<sup>3</sup></b>
--	--	Photoionization	Total Ionizable Hydrocarbons	Daily	None
--	--	Flame ionization	VOC	Per measurement	Weekly
--	--	Ultraviolet	SO <sub>2</sub>	Weekly	Zero, Span, Drift, etc.
--	--	Foil	Dissolved O <sub>2</sub>	Daily	Calibration Check

<sup>1</sup> Compound, Analyte, or Detector Response.

<sup>2</sup> Calibrator Source, such as Hexane, Reference Material, etc.

<sup>3</sup> Frequency of Zero, Span, Response Time, Calibration Check, etc.

**3.3.4.7.4 Geophysics.** This section of the FSP should include a discussion of the objectives of geophysical analysis and the techniques proposed to meet these objectives. It should also address general topics discussed in Paragraphs 3.3.4.7.1 and 3.3.4.7.2, as appropriate. The discussion should include the rationale used to delineate the study area and determine the spacing for the geophysical measurements. The proposed equipment, equipment calibration, and quality control procedures; preliminary testing of the method employed and early termination procedures; reporting requirements; delineation of the area to be investigated; data processing; and interpretation of the data should also be included. Refer to EM 1110-1-1802, Geophysical Exploration for Engineering and Environmental Investigations, for the required information covering geophysical surveys.

3.3.4.7.5 Soil gas survey. This section of the FSP should define the type of soil gas survey to be performed (active or passive); provide a discussion of the objectives of the survey and the rationale for selecting the location and frequency of soil gas samples; define the equipment and methods used for drilling, the materials (casing, screen, etc.), and the installation methods, sampling methods, documentation requirements, and any of the general topics discussed in paragraphs 3.3.4.7.1 and 3.3.4.7.2 above. Refer to Instruction C-8, Appendix C, for further information on soil gas sampling.

3.3.4.7.6 Ground water. This section of the FSP should include a discussion of the objectives for ground water sampling, monitoring well location rationale (e.g., to determine ground water flows, identify upgradient contaminant sources) and the rationale for screen depth placement. Methods for monitoring well installation should be discussed and/or relevant SOPs attached to the SAP, including design construction details, procedures for well development and well purging, obtaining a water level measurement or determining if free product is present, aquifer testing and any field measurements, defining required pumps, filters, drilling and sampling equipment decontamination procedures, and well development and/or purge water disposal requirements. Also, refer to paragraphs 3.3.4.7.1 and 3.3.4.7.2 for additional topics to be addressed. It is suggested that this section of the FSP include a table to summarize the well depths, casing diameters, screen intervals, etc., for new and existing monitoring wells to be sampled. Additional language should be presented within the FSP to discuss whether free product is anticipated and the effect that may have on the sampling event. Refer to EM 1110-1-4000 for required information on installation of ground water monitoring wells at HTRW sites and Instruction C-2, Appendix C, for more information on ground water sampling.

3.3.4.7.7 Ground water filtration. There are diverse views on the filtration of ground water before sample preservation for metals analysis. Many regulatory programs no longer accept filtered samples as representative of “dissolved metal” concentrations. Studies also indicate that the results from unfiltered samples may be affected more by well installation and development procedures than ground water contamination present. Options include filtering; not filtering; or the use of alternative sampling techniques (i.e., low-flow sampling techniques). The option selected should be based on the objectives of the specific project including the acquisition of samples representative of aquifer geochemistry and contamination, the intended use of the analytical data, comparability with previous site results, and the position of the regulators. Since metals that are attached to soil particles present during digestion will also be detected, higher metal concentrations are typical for the unfiltered ground water sample than for the filtered sample. However, carbon dioxide and oxygen concentrations may change over time once a ground water sample has been taken. This may lead to changes in pH and Eh, which in turn may lead to the precipitation of metal species. Therefore, delayed filtration may result in the precipitation of metals, which are then filtered, resulting in even lower dissolved metals concentrations. For this reason, filtration of samples, if specified, should be performed shortly after collection within the field, preferably using an in-line system, in lieu of having the laboratory perform this procedure. Field filtration procedures must be conducted prior to sample preservation (acidification), and both should be performed prior to sample shipment. Instructions C-2 and E-1, found in Appendices C and E, respectively, contain additional information on ground water sampling and filtration techniques. Refer to EPA 540/4-89/001 and Heidlauf and Bartlett (1993) for additional information on this topic. An alternative procedure to filtering samples is the use of a low-flow (minimal drawdown) sampling technique for sample acquisition (see EPA 540/S-95/504). This technique is the preferred method to obtain representative ground water samples, especially for redox sensitive analytes such as chromium. In addition to obtaining a sample that has both the dissolved and natural colloidal fraction of the ground water, the amount of purging and investigation-derived waste can be minimized. This method requires the use of an appropriate pump and a flow-through cell with a multiparameter probe (dissolved oxygen, pH, oxidation-reduction potential, temperature, total dissolved solids, and turbidity). There is also less agitation of the sampled media with

this technique; therefore it is a preferred method for the collection of volatile samples. Refer to Instruction C-2, Appendix C, for further information on low-flow sampling techniques.

3.3.4.7.8 Subsurface soil. This section of the FSP should discuss the objectives of subsurface soil samples and the rationale for soil boring locations, note discrete and/or composite sampling, and discuss any field analytical parameters to be measured. When compositing of samples is done, define the size and shape of the grid pattern and number of subsamples to be combined. This section should also discuss drilling methods, sampling methods for physical and chemical analyses, decontamination procedures of the drilling equipment, documentation and logging procedures, and the general topics discussed in paragraphs 3.3.4.7.1 and 3.3.4.7.2. Documentation of soil boring information is required in order to log facts into the Geospatial Data System as outlined within Instruction F-1, Appendix F. Additional information on subsurface soil sampling procedures is presented in Instruction C-6, Appendix C, and in EM 1110-1-1906.

3.3.4.7.9 Surface soil and sediment. This section of the FSP should discuss objectives of surface soil and/or sediment samples, the rationale for location and frequency of discrete and/or composite samples, all procedures required for collecting samples, and any applicable topics from paragraphs 3.3.4.7.1 and 3.3.4.7.2. When compositing of samples is done, define the size and shape of the grid pattern and number of subsamples to be combined. Instructions C-5 and C-6 in Appendix C contain additional information on sampling of sediments and surface soils.

3.3.4.7.10 Surface water. This section of the FSP should discuss the objectives and types of surface water or surface water runoff to be sampled, the rationale for the location and frequency of these samples, all procedures required for collecting surface water samples, and any applicable topics identified in paragraphs 3.3.4.7.1 and 3.3.4.7.2. Instruction C-3, Appendix C, contains additional information on the sampling of surface water and/or surface water runoff.

3.3.4.7.11 Other matrices. This section of the FSP should discuss the rationale for the location and frequency of samples from other matrices and the general topics discussed in paragraphs 3.3.4.7.1 and 3.3.4.7.2. Examples of other matrices include perimeter or point-source air samples, various media (solid, liquid, or gas) from remedial process waste streams, potable water supplies, surficial samples, bulk materials, etc. Appendices C and D contain information on sampling other matrices.

3.3.4.8 Field operations documentation. This section of the FSP should identify the records used to document all field operations. The FSP should also identify the records and schedule for those which require periodic submittal to a USACE representative. Project records may include the daily contractor QC reports, field logbook, field sheets, or other logs (i.e., boring logs, well installation diagrams, well development forms), any photographic records, and any field analytical records. This section should also address the sample documentation records, such as the sample numbering system, sample labels, tags, or sample field sheets, chain-of-custody forms, custody seals, and lab notification sheets. Corrections to documentation entries must be defined according to procedures identified in paragraph F-1, Appendix F. Include all proposed forms and tables within this section of the project FSP. Custody requirements for the samples should be defined, as applicable, during sample collection, transfer, and within the laboratory. Custody requirements should also be established for the final evidence papers of the project. This includes all originals of field documentation and laboratory reports. Also define records management practices, such as review procedures and record retention requirements. Other records may also be included within this section, such as SOPs, corrective action reports, any manifesting, bills of lading, waste profile forms, test pit logs, drum log sheets, etc. Refer to Instruction F-1, Appendix F, for additional information on documentation.

3.3.4.9 Sample packaging and shipping requirements. This section of the FSP should include a discussion of sample packaging and shipping requirements in accordance with U.S. Department of Transportation regulations. Identify all appropriate laboratories, noting addresses and points of contact; a schedule for submitting samples; the mode of sample transportation (e.g., overnight courier); and any manifesting requirements for the shipment. A checklist is recommended to verify completeness of sample shipment preparations. An example facsimile of a checklist for shipping HTRW samples is presented in Figure 3-2. It is recommended that the receiving laboratories also document the condition of field samples upon receipt at the laboratory. This enables verification of correct sample volumes, sample preservation, cooler temperature, chain-of-custody completeness and accuracy, and overall packaging techniques. An example facsimile of a cooler receipt documentation is presented in Figure 3-3. Another document beneficial to the laboratory by providing information on sample custody, preparatory/analysis methods, and data reporting requirements is the Laboratory Notification Checklist (LNC). It is recommended that the LNC be prepared and forwarded to the lab with the approved SAP, and a copy accompany the first shipment of incoming samples to the primary and referee (QA) laboratories. A facsimile of the LNC is presented in Figure 3-4. Instruction F-2, Appendix F, gives more information on sample packaging and shipping procedures; and sample receipt/log-in procedures are noted in paragraph I.5.1, Appendix I.

3.3.4.10 Investigation-derived wastes (IDW). This section of the FSP should discuss the procedures for collecting, labeling, storing, and disposing of the IDW. The procedures for assessing corresponding sample results or sampling the IDW to determine whether it is hazardous should be explained. Finally, the discussion should address how the sample results will be evaluated to determine disposal options for the IDW. It is important to note that disposal actions must be conducted with the concurrence of appropriate USACE technical personnel and that the final disposal decision must be agreed to by all parties.

3.3.4.11 Field assessment/three-phase inspection procedures. The contractor is required to ensure that quality is maintained throughout all field work by means of a three-phase control process (Engineer Regulation (ER) 1180-1-6 and Corps of Engineers Guide Specifications (CEGS) 01450 and 01451). Contractor quality control (CQC) phases (preparatory, initial, and follow-up) are performed onsite by a contractor-assigned QC officer whether or not a Government representative is present. The Contractor will summarize the activities of each CQC phase in the daily QC report. The CQC phases are performed for each definable feature of work. A definable feature is a task that is separate and distinct from other tasks and has separate control requirements. For example, the definable features of the sample collection task include, at a minimum, each matrix (air, water, soil, containerized waste, etc.). This section of the FSP should contain the contractor's detailed plans for implementing the CQC process, including identification of the CQC representative; listing of field equipment; description of activities during the phases; identification of the definable features of work; and generation of a sample table that will be used to match up primary and QA samples, as well as other field control samples required for the project. Paragraph G-1 in Appendix G contains additional information and checklists to help plan the preparatory and initial phases, and Table 3-3 is an example of a sample summary table. The equipment list noted may also be used by USACE QA personnel to support their preparatory phase inspection procedures of CQC. For USACE in-house projects, this section will include a list of the field equipment that will be required to perform the field activities and a sample table that correlates field samples to the appropriate field control (QA/QC) samples.

3.3.4.12 Nonconformance/corrective actions. The FSP should include corrective action procedures to be taken in the event a discrepancy is discovered by field personnel or during a desk or field audit, or the laboratory discovers discrepancies or problems. Typical discrepancies or problems include but are not limited to improper sampling procedures, improper instrument calibration procedures, incomplete or improper sample preservation, and problems with samples upon receipt at the laboratory.

### SHIPPING CONTAINER CHECKLIST SUMMARY

ATTN.: Corps of Engineers Contractors

Failure to properly handle or document the Project samples could jeopardize the useability of the sample results and ultimately the project. Prior to sending this cooler to the Analytical Laboratory at the address shown below, please check the following items:

- Is the project clearly identified on the Chain-of-Custody (official project name, project location, project phase)? Is the United States Army Corps of Engineers project number from the Sampling and Analysis Plan clearly indicated on the Chain-of-Custody?
- Are all enclosed sample containers clearly labeled with waterproof (permanent) ink and enclosed in a plastic bag?
- Are the desired analyses indicated on the bottle labels and chain-of-custody? Are the metals defined on the Chain-of-Custody (e.g., metals = lead, cadmium, etc.)?
- Are the sample labels complete, including the identification of appropriate method numbers for both the preparatory and analysis procedures?
- Does the information on the Chain-of-Custody match the information on the sample container labels?
- Have you placed the Chain-of-Custody in a plastic bag and attached it to the inside of the cooler lid?
- Have the samples been properly preserved (acid or base and cooling to  $4^{\circ}\text{C} \pm 2^{\circ}\text{C}$ )?
- Is there a Contractor point of contact including name and phone number clearly shown on the Chain-of-Custody?
- Is there sufficient ice (double bagged in zip-locks) or “blue ice” in the cooler? It is recommended that the samples be placed on ice as soon as possible after sampling and repacked on new ice in shipping cooler.

This is a partial list of the requirements for proper documentation and shipping of the environmental samples. Please refer to the Sampling and Analysis Plan for further details.

**Figure 3-2. Shipping container checklist**

COOLER RECEIPT FORM		Contractor Cooler _____
LIMS# _____	QA Lab Cooler # _____	
		Number of Coolers _____
PROJECT: _____		Date received: _____
USE BOTTOM OF PAGE 2 OF THIS FORM TO NOTE DETAILS CONCERNING CHECK-IN PROBLEMS.		
A. PRELIMINARY EXAMINATION PHASE: Date cooler was opened: _____		
by (print) _____ (sign) _____		
1.	Did cooler come with a shipping slip (air bill, etc.)? ..... YES NO If YES, enter carrier name & air bill number here: _____	
2.	Were custody seals on outside of cooler? ..... YES NO How many & where _____, seal date: _____ seal name: _____	
3.	Were custody seals unbroken and intact at the date and time of arrival? ..... YES NO	
4.	Did you screen samples for radioactivity using the Geiger counter? ..... YES NO	
5.	Were custody papers in a plastic bag & taped inside to the lid? ..... YES NO	
6.	Were custody papers filled out properly (ink, signed, etc.)? ..... YES NO	
7.	Did you sign custody papers in the appropriate place? ..... YES NO	
8.	Was the project identifiable from custody papers? If YES, enter project name at the top of this form ..... YES NO	
9.	Were temperature blanks used? ..... YES NO Cooler Temperature _____ (°C) Thermometer ID No. _____	
10.	Have designated person initial here to acknowledge receipt of cooler: _____ (date) _____	
(Continued)		

Figure 3-3. Cooler receipt checklist (Note: LIMS = Laboratory Information Management System) (Continued)

B. LOG-IN PHASE: Date samples were logged in: \_\_\_\_\_  
by (print) \_\_\_\_\_ (sign) \_\_\_\_\_

11. Describe type of packing in cooler: \_\_\_\_\_

12. Were all bottles sealed in separate plastic bags? ..... YES NO

13. Did all bottles arrive unbroken with labels in good condition? ..... YES NO

14. Were all bottle labels complete (ID, date, time, signature, preservative, etc.)? .... YES NO

15. Did all bottle labels agree with custody papers? ..... YES NO

16. Were correct containers used for the tests indicated? ..... YES NO

17. Were samples preserved to correct pH, if applicable? ..... YES NO

18. Was a sufficient amount of sample sent for tests indicated? ..... YES NO

19. Were bubbles absent in volatile organic analysis (VOA) samples? If NO, list  
VOA samples below ..... YES NO

20. Was the project manager called and status discussed? If YES, give details  
on the bottom of this form ..... YES NO

20. Who was called? \_\_\_\_\_ By whom? \_\_\_\_\_ (date) \_\_\_\_\_

		PREP	CLEANUP	ANALYSIS	

9. Any Special Requirements (i.e., unusual target analytes, sample quick turnaround time (TAT)):

**Figure 3-4. Laboratory notification checklist**

3.3.5 Quality assurance project plan (QAPP). The following paragraph briefly describes the minimum requirements of a QAPP.

3.3.5.1 Title page. The title page should include the name of the document, (e.g., Phase I Remedial Investigation Quality Assurance Project Plan) and the date it was prepared. The contractor's laboratory QA manager or director should sign the title page if analytical services are provided. This will ensure that the laboratory is aware of the analytical methods employed and the measurement quality objectives for precision, bias, representativeness, completeness, comparability, and sensitivity. If the recommended signatures are difficult to acquire, suggest a statement be added that the approved SAP was provided to the appropriate parties and identify names of recipients and the date.

3.3.5.2 Table of contents. The table of contents should list the QAPP elements, any appendices that are required to augment the QAPP, and the titles of figures and tables. At the end of the table of contents the recipients of official copies of the QAPP should be listed.

3.3.5.3 Project laboratory organization and responsibilities. This element of the QAPP identifies key laboratory personnel or organizations that are necessary for each analytical activity during the study. All laboratories involved should be identified within this section, including the primary and referee (QA) laboratories. A table or chart showing the organization and lines of authority should be included. When specific personnel cannot be identified, the organization with the responsibility should be listed. The organization chart should also include all subcontractors and their key points of contact. Separate organization charts for subcontractors may also be needed. The organization chart should identify QA managers, including those of subcontractors, and should illustrate their relationship to other project personnel. The QA managers should be organizationally independent of project management so that the risk of conflict of interest is minimized. Requirements for the contractor's laboratory and laboratory personnel are located in Appendix I.4.3.

3.3.5.4 Data assessment organization and responsibilities. This element of the QAPP identifies personnel or organizations that will be performing data assessment activities. Applicable duties of personnel should be identified, and may include data review, verification, and/or validation procedures. A table or chart showing the organization and lines of authority and communication should be included. Refer to EM 200-1-6 for further information on data assessment procedures available.

3.3.5.5 Data quality objectives. Data quality objectives should be identified within this section to define the intended use of the data, and any specific conditions, criteria, or limits to be applied to the data based upon this use. Specific information to be included is outlined in the following sections.

3.3.5.5.1 Data use background. This section should highlight project-specific data needs that have been identified for the project, short-term decisions that will be made during the project planning phase, and long-term decisions that will be made prior to project closeout. A brief summary of the type of samples (media) and analyses (screening versus definitive, and applicable chemical parameters) that will be required to meet the data needs should also be included in this section. Refer to Sections I.3.1 and I.3.1.2 for a discussion of background information to be included in this section of the QAPP.

3.3.5.5.2 Measurement quality objectives for chemical data measurement. This section should describe the QA elements to be applied to the project to ensure proper CDQM. In addition, measurement quality objectives (MQOs) are established for key data quality indicator terms (precision, accuracy, sensitivity, etc.) to evaluate these QA elements for each matrix and analytical method. Refer to EM 200-1-6 for information on QA elements; and Appendix I for discussions on data quality indicators, MQOs,

and baseline method performance objectives. A cooperative effort should be undertaken by USACE, the lead agency, the contractor, and the laboratory staff when defining the project-specific MQOs required for the data. They should be based on a common understanding of the intended use of the data, available laboratory procedures, and available resources. However, these objectives should be defined in terms of project requirements, not in terms of the capabilities of the test methods. In addition, sensitivity (detection limits) expressed within a method are often based on a reagent water matrix and may not be achievable within an environmental matrix. However, when the requirements for the project are defined, the quality requirements established by the data user, the complexity of the media to be analyzed, the potential for interferences, etc., must be considered. This section should also address whether precision is being applied to field activities, to assess the laboratory performance, or both. Separate precision goals should be established for grab samples of a heterogeneous media (i.e., soil VOC samples). However, when sample handling techniques used are the same (i.e., field and laboratory duplicates of aqueous or homogenized soils), a separate criterion is not necessary. Because precision and bias can be measured in various ways, the calculation to be used should be identified. Completeness goals must be defined quantitatively, and whether it is being applied to individual samples, or for the work effort as a whole. Refer to Appendix I for further information on the remaining parameters of representativeness, comparability, and sensitivity. The use of tables to define the appropriate MQOs for each analytical method is recommended. Appendix I includes summary tables with default values that may be used verbatim, or changed to reflect project-specific DQOs. Due to the limited applications where the implementation of an EPA standard method is mandatory, these MQOs must be specified directly within the QAPP verbatim or by reference to ensure application to the project sample analyses. If the project MQOs are unattainable by available methods, either the methods or test plan must be compensated for these deficiencies. The following statements are examples of descriptions for precision and bias:

- Field precision objectives for the soil VOC samples are presented as relative percent difference of field duplicates and are presented within the attached tables. Any exceedance of the MQO values will trigger corrective action requirements as noted in Appendix I.
- Bias objectives for organic compounds are given as a percent recovery range of all target analytes within the laboratory control sample and matrix spikes, and as surrogate compounds in all field and QC samples. Bias goals are established by calculation of percent recovery, and are presented within the attached tables. Any exceedance of the MQO values will trigger corrective action requirements as noted within Appendix I.

3.3.5.6 Sample receipt, handling, custody, and holding time requirements. This section should identify the requirements for sample receipt condition verification, sample storage and/or handling requirements, any intralaboratory custody requirements, and analytical parameter holding times. In addition, all notifications, customer correspondence, and corrective actions for incoming samples must be thoroughly documented and available for review.

3.3.5.7 Analytical procedures. This section of the QAPP identifies the appropriate analytical test methods to be used for each environmental sample. The applicability of an individual method will be dependent upon the regulatory authority and the level of data quality required to support the data needs and decisions of the project. Applicable regulations that mandate the use of certain methods for any of the sample matrices and parameters listed in the project description should be specified. The use of tables is recommended to present this information clearly. It is suggested that the table be divided into each AOC, with proposed chemical parameters (including preparatory and analytical method numbers) defined for each matrix to be sampled within that area. Analytical chemistry requirements are presented in Appendix I.

3.3.5.7.1 Preventive maintenance. This section of the QAPP should discuss the laboratory's preventive maintenance plan that will be implemented to minimize downtime of laboratory instruments. If appropriate for the project, include a reference to Appendix I in order to apply the requirements specified therein.

3.3.5.7.2 Calibration procedures and frequencies. This section of the QAPP discusses the calibration procedures that are to be used by the contractor's laboratory. Issues that should be addressed in this section include defining the number and concentration of calibration standards to be used, the calibration range, and the procedures used to establish and verify the calibration of the laboratory's instruments. If appropriate for the project, include a reference to Appendix I in order to apply the requirements specified therein.

3.3.5.7.3 Laboratory QC procedures. This section of the QAPP identifies the specific internal QC measures to be used by the laboratory when performing the analytical tests. Type and frequencies of specific QC samples performed by the laboratory are dependent upon the specified analytical method. Internal QC methods require performance on a sample batch basis and include analyses of method blanks, laboratory control samples, and actual environmental samples as duplicates, matrix spikes, and matrix spike duplicates. Additional QC is incorporated into the analytical sequence. A more detailed discussion of internal QC procedures is presented in Appendix I. If appropriate for the project, include a reference to Appendix I in order to apply the requirements specified therein.

3.3.5.7.4 Performance/system audits. This section of the QAPP describes the performance and system audits that will be performed onsite and at the contractor's laboratory. The laboratory audits are typically conducted internally by the laboratory QA staff, as well as by external agencies. USACE performs laboratory audits in conjunction with the laboratory validation process. District personnel are encouraged to perform precontract or preaward system audits of the laboratory to ensure that proper communication and awareness of project DQOs are in place.

3.3.5.7.5 Nonconformance/corrective actions. This section of the QAPP addresses corrective actions that must be implemented if MQOs are not met. The QAPP should discuss corrective action procedures that will be implemented if problems are observed with incoming samples, sample holding times, instrument calibration procedures, specified detection and quantitation limits, or internal QC samples. Corrective actions may include resampling, reanalyzing samples, or auditing laboratory procedures. The QAPP should identify persons responsible for initiating these actions. It should also contain procedures for identifying and documenting corrective actions and procedures for reporting and follow-up of corrective actions. A more detailed discussion of corrective action procedures is contained in Appendix I. If appropriate for the project, include a reference to Appendix I in order to apply the requirements specified therein.

3.3.5.8 Data reduction/calculation of data quality indicators. This section of the QAPP should discuss how data are reduced by the laboratory and define how the precision, bias, sensitivity parameters (detection, quantitation, and reporting limits), and completeness goals are to be calculated from the project data. Data reduction procedures must be summarized and the persons responsible for data reduction must be identified. A more detailed discussion of the methods used to calculate these data quality indicators is presented in Appendix I.

3.3.5.9 Laboratory operations documentation. This section of the QAPP discusses the data reporting procedures for the project. The reporting package format, contents, reporting schedule, data archival, and records retention requirements should be identified. Any electronic data deliverables

format and technical content must be identified here also. Refer to Appendix I for information on the potential content requirements for screening, definitive, performance-based, and comprehensive data packages. For projects that involve a substantial number of samples, or projects that require continued monitoring, the use of interim data deliverables for reporting is recommended. These deliverables should be submitted after a proposed milestone instead of at the project completion.

3.3.5.10 Data assessment procedures. This section of the QAPP discusses the data review, verification, or validation process that is required to assure the validity of the data. It also discusses the DQO reconciliation process and the effect that it has on the final assessment of project completeness. Refer to EM 200-1-6 for further information on data assessment procedures.

3.3.5.10.1 Data QC review. The data review process should be discussed. Personnel who will have the various roles and responsibilities must be addressed in detail. The use of diagrams is suggested to outline the flow of the data as the project progresses.

3.3.5.10.2 Data verification/validation. The project requirements for data verification or validation must be defined. Terms used (i.e., validation) and procedures for implementation must be clearly defined in order to avoid any confusion on the anticipated level of effort for this task. A discussion of these terms, i.e., data review, validation, etc., and their requirements are presented in EM 200-1-6. Based on the project data use, implementation of an independent validation of the data may be necessary. Provide details on the percentage of data undergoing the validation process, and the procedures to follow. Refer to other USACE guidance for procedures for performance-based review, and validation procedures to encompass a manual full data validation for common EPA SW-846 methods.

3.3.5.10.3 DQO reconciliation. DQO reconciliation procedures should be identified. Details must be included that identify the personnel responsible for these tasks (contractor and/or USACE), the procedures to follow, any statistical tests to be employed, etc. DQO reconciliation is generally discussed in EM 200-1-2 and EM 200-1-6. Further guidance on this subject may be obtained from EPA QA/G-9.

3.3.5.10.4 Project completeness assessment. Completeness assessment for the project is also discussed in EM 200-1-6. Procedures for the contractor as well as for USACE anticipated for the project should be defined within this section of the QAPP.

3.3.6 Appendices. References, standard forms, and a list of abbreviations and acronyms, for example, should be included in appendices.
